

DAY 1-AI AUTOMATION INTERNSHIP

Intern Name	Musaddiqa Fiaz
University / Institute	Hazara University
Internship Domain	AI Automation
Organization	Petalnex Pvt.Ltd.
Supervisor / Team Lead	Sohail Anwar
Date	31 July 2026

1. CV Screening & Recruitment

Current Manual Process:

HR receives CVs through email or job portals, downloads each CV, reviews qualifications manually, shortlists suitable candidates, and sends interview emails.

Problem:

Reviewing many CVs takes a lot of time, qualified candidates may be missed, and communication with applicants is often delayed.

Trigger:

A candidate submits a CV through a job portal, email, or application form.

Input:

Candidate's CV (PDF/DOC), personal information, and the job position applied for.

Processing Required:

Extract candidate information, compare skills and experience with job requirements, score the CV, shortlist qualified candidates, save details in the recruitment system, and send confirmation or interview emails.

Expected Output:

A shortlisted candidate list, updated recruitment records, and automated email notifications.

Benefits of Automation:

Faster recruitment, reduced manual effort, consistent candidate evaluation, quicker communication, and improved hiring efficiency.

2. Customer Support Ticket Management

Current Manual Process:

Customers send emails or fill out support forms. Support staff manually create tickets, categorize issues, and assign them to agents.

Problem:

Responses are slow, tickets may be missed or duplicated, and manual assignment wastes time.

Trigger:

A customer submits a support request.

Input:

Customer name, contact details, and issue description.

Processing Required:

Create a support ticket, categorize the issue, assign it to the appropriate agent, and send a confirmation email to the customer.

Expected Output:

A support ticket is created and assigned automatically, and the customer receives a confirmation.

Benefits of Automation:

Faster response times, better customer satisfaction, fewer manual errors, and improved ticket tracking.

3. Invoice Processing

Current Manual Process:

The finance team receives invoices, manually enters the data into accounting software, verifies the details, and requests approval.

Problem:

Manual data entry is slow and can lead to errors and delayed payments.

Trigger:

A new invoice is received by email or uploaded to the system.

Input:

Invoice document, vendor details, invoice amount, and due date.

Processing Required:

Extract invoice information, validate the data, send it for approval, and store it in the accounting system.

Expected Output:

A verified invoice ready for approval and payment.

Benefits of Automation:

Reduced data entry errors, faster processing, timely payments, and improved financial accuracy.

4. Sales Lead Management

Current Manual Process:

Sales representatives collect leads from websites, emails, and social media, then manually enter the information into a CRM.

Problem:

Leads can be lost, follow-up is delayed, and duplicate records may be created.

Trigger:

A new lead submits an inquiry or fills out a contact form.

Input:

Lead's name, email address, phone number, company, and inquiry.

Processing Required:

Validate the lead information, add it to the CRM, assign it to a salesperson, and send a welcome email.

Expected Output:

The lead is stored in the CRM and assigned to the appropriate sales representative.

Benefits of Automation:

Faster lead response, improved lead tracking, increased sales opportunities, and reduced manual work.

5. Social Media Content Publishing

Current Manual Process:

The marketing team manually posts content on different social media platforms according to a content calendar.

Problem:

Posting manually is repetitive, time-consuming, and may lead to missed or inconsistent posting schedules.

Trigger:

The scheduled publishing date and time.

Input:

Post content, images or videos, hashtags, and publishing schedule.

Processing Required:

Publish the content automatically on selected platforms, record the posting status, and generate engagement reports.

Expected Output:

Content is published automatically, and posting records are updated.

Benefits of Automation:

Consistent posting schedule, time savings, improved productivity, and better marketing performance.
